

Shopify Website

Under Sales Channels > Online Store you will see your websites Desktop and Mobile Theme Settings. This section is not intended to tell you exactly how you can or should build your website - you have a lot of freedom in how you approach this. But we will include some notes and tips to help you along your way.

This is where you get to develop your website. At this point in time ScryPOS has no custom Shopify integrations and so there is no limitations imposed on your store, theme by us. You can do whatever you want!

If you are coming from an existing Shopify store you can export your theme files from your previous store and import them into this Shopify account. Note this is not recommended when exporting a website developed by another service provider (i.e. exporting a BinderPOS website theme and using it here - you should only export and import a theme that you have the explicit ownership rights of)

If you require assistance with developing and laying out your initial Shopify website please contact lifelink@scrypos.com and we will be in touch with options for assistance.

Shopify Tips

Customer Dashboard

Customers in ScryPOS have their own Customer Dashboard and you can find the link to this in your own ScryPOS dashboard. Be sure to contextually link customer to their ScryPOS dashboard! This is where customers go to sell you cards and access their store credit for web purchases. If you want to add this to a Shopify menu you do this under "Content > Menus"

Persistent Carts (App)

Shopify does not natively support persistent carts. This means if a customer logs in on Shopify and creates a cart on their PC, if they log into their mobile device this cart will not automatically be carried across. Personally I have had a good experience using Persistent Cart - Sync Devices by Customer First focus.

Shopify Flows (App)

Shopify is a great ecommerce solution but it does not do everything. The more you use it the more likely you are to find things that you wish it did slightly differently. Shopify Flows is an app that lets you create smart rule-based trigger automations to make Shopify work in a way that suits your needs better
